

Description and choice data for the domain “Marijuana”

Description of the choice domain 16, Marijuana

The prompt question and the universe of five response options in the choice domain **Marijuana** are as follows. The labels *a*, *b*, *c*, *d* and *e* were not displayed during the experiment and are indicated here to allow cross-referencing with data tables and visualizations below and results in the paper.

This question elicits policy preferences.

Which one of the following marijuana policies would you choose?

- Possession by, and sales to adults are both legal; sales to minors are illegal.
- Possession by, and sales to adults are both illegal but neither is a criminal offense; sales to minors are a criminal offense.
- Possession is illegal but not criminal; all sales are a criminal offense.
- Possession and sales are criminal offenses, with a small number of medical exceptions.
- Possession and sales are criminal offenses, without exception.

The following figure is a screenshot from the actual experiment, with one of the 26 possible menus for this domain.

Marijuana

Which one of the following policies on marijuana would you consider the most acceptable?

- ☐ Possession would be illegal but not criminal; all sales would be a criminal offense
- ☐ Possession by, and sales to, adults would be both legal; sales to minors would be a criminal offence
- ☐ Possession by, and sales to, adults would be both illegal but neither would be a criminal offense; sales to minors would be a criminal offence

Table 1: Observed choice counts and proportions.

Choice data for domain 16, Marijuana

Table 1 shows choice counts and choice proportions for this choice domain. For each menu A and each object $x \in \{a, b, c, d, e\}$, $N_A(x)$ is the number of participants who chose object x from menu A and $\hat{P}_A(x)$ is the corresponding proportion of participants who chose x from A . When $x \notin A$, a dash is displayed.

The following figure displays choice proportions for all doubleton and tripleton menus in Barycentric coordinates. See a full description of this graphical representation in the paper. Each panel shows choice proportions for all doubleton and tripleton menus of a different tripleton subset of $\{a, b, c, d, e\}$. The downward-pointed (blue) triangle shows the set of ternary choice proportions that are compatible with regularity and the three binary choice proportions, on the corresponding tripleton. The upward-pointed (red) triangle shows the set of ternary choice proportions compatible with the multiplicative inequality and the three binary choice proportions.
